Field	Description
Introduction	The DFD Level 0 (Context Diagram) represents the entire Sho8la system as a single process interacting with its environment. It shows the flow of data between the system and external entities.
Objectives	1. To define the system's boundaries and external interfaces. 2. To identify the sources of input data and destinations of output data.
Functional Requirements	1. The system must accept job details and payments from the **Client**. 2. The system must accept work deliverables and ID verification data from the **Freelancer**. 3. The system must integrate with **Paymob** to process transaction signals.
Non-Functional Requirements	**Interoperability:** The system must successfully exchange data with external APIs (Paymob). **Reliability:** The system must handle input errors from external entities gracefully.
