Field	Description
Introduction	The DFD Level 1 decomposes the main system into its primary sub-processes (Auth, Job Management, Proposal Management, Payment). It details how data flows between these internal processes and data stores.
Objectives	1. To visualize the internal data transformation logic. 2. To identify the specific data stores (Users DB, Jobs DB, Transactions DB) required.
Functional Requirements	1. **Process 1.0 (Auth):** Must verify user credentials and ID photos. 2. **Process 2.0 (Jobs):** Must store and retrieve job postings. 3. **Process 4.0 (Payments):** Must handle the escrow logic and balance updates.
Non-Functional Requirements	**Data Consistency:** Data moving between processes must remain accurate. **Security:** Data flows containing sensitive info (passwords, money) must be encrypted.
